Video Script:

So, what exactly is Vaping?

Vaping is basically just an alternative to, you know, smoking cigarettes.

The way we vape is simply by taking a **resistance wire**, applying power to it to heat it up and producing a vapor.

So normally what is in the liquid is a range of 4 main ingredients. We have Propylene Glycol or PG, Vegetable Glycerin or VG, we also have nicotine which is either suspended in VG or PG and then we have the flavoring itself.

There are in fact different levels of nicotine.

So if you take a look of this list right here, you can see the available levels of nicotine that we offer. So if you take a look at 24mg and 18mg first, that is going to be equivalent to let's say a pack a day smokers smoking Marlboro REDS or like even Camel Full Flavors.

We also have 12mg and 6mg which is equivalent to your Marlboro lights and Ultra Lights also when you are going down to 0 and 3mg, it's the same kind of thing and also your device have a factor.

So what I have in front of me is just a broad spectrum of the **DEVICES that we offer**.

So right here is a simple Starter Kit, this what you're gonna find specially when you are first starting vaping.

Next is the EGO ONE, which is a new device but we offer it just because it's a well rounded device for everyone.

And right here, we actually have a high powered box mod capable of pushing a 120W which is kind of a big deal.

So when I was saying the nicotine does matter, the more powerfull device you have, the less nicotine you can actually use and get the same result.

So if you already use a 24 in this and then go from 24mg in this to this device you would have a really really bad time. Reason being is this device just produces a lot more vapor at once, which means you absorb a lot more nicotine at once.

So, the Ratios are also another factor when buying an e-liquid.

So im just gonna pull off a bottle form our shelf and just show you what's going on. So you can see this is one of our bottles, E LIQUID BY DTV "alien throat punch", and right here we actually list the nicotine content and the ratio. So you could see here it says 30/70 and what that basically means is there is 30 percent Propylene GlycoL to 70 percent Vegetable Glycerin. So back to the two main components PG and VG.

VG is gonna give you a really nice voluminous cloud, it's gonna be easy on the throat and pg is quite the opposite. It's gonna give you a nice throat hit but at the same time It's gonna give you a lot of flavor as well.

So we go back to three devices, the higher vg levels or the thicker stuff, it's gonna be smoother it's more geared towards the higher powered box mods just because they are producing a lot more vapor.

We usually recommend a 50/50 or even a higher PG blend, the smaller the device you actually own.

So every electronic cigaretter whether big or small has three main components.

You have the battery which on you basic model is the whole bottom part with the button attached. If you pull it off off the bigger mod, you could see that the batteries are removable

and they are quite big compared to your normal AA or AAA battery.

I'll go into detail on why that is.

So your next component would be your HEATING COIL.

Every single vape needs 3 components, like I said, you got your battery, you got your coil and you need your reservoir to hold your actual liquid.

So this right is the the coil for the basic atomizer, all of the good stuff is actually in here where this little two brushes or what we call wicks are. And I can just show you a nice expanded version of what's going on in there. So if you look right here you can actually see, the coil units there and the you have your wicking hangin down into what we call a deck.

So moving on to the third step, your reservoir.

You need somewhere to actually hold your juice in the mean time, in between vapes. So right here you just fill it up from the bottom. You dont wanna get it too high up in here,or else it will get in your mouth, so there is a little fill line that will give you.

Now it is a little trickier with the high powered vapes,it's just because there is not a lot of room to hold the liquid. So like Im always saying, on the deck there is what is known as the drip well, it's kinda hard to see in this unit but there is a nice little reservoir sitting down there where the liquid actually collects.

You can vape here, and you can vape here, and you can even vape here and here, you wouldn't want but to, but you can. And even he— ohh wait.. yeah you just gotta be carefull where you vape, the golden rule is " only vape where you are allowed to smoke". And a side note, like I said the golden rule is vape anywhere you smoke but feel free to ask certain businesses, I'm sure they will let you.

So most people start off on your basic setup, what is known as an EGO style pen, just because it's a very small device. There is not a lot that can go wrong with these so it's just a very good choice to start off.

The golden rule is what ever fits you best.

I've seen some people start off with one of the higher powered devices just because it fits their needs to what they want. Same with even the EGO 1, it's got a middle of the road features you can change your air flow which will increase or decrease your vapor. But it also has some of the very comforting features like the removable coil, so you don't have to rebuild, Fillable tanks so you don't have to worry about re-dripping throughout the day. and also the fact that the battery charges without having to take the unit apart really makes it a good choice for absolutely anyone.

So like I said, it all depends on what you are looking for in terms of vape.

So depending on if you want to quit smoking cigarettes or just try something new, I'm sure vaping will have a spot for you .

Uhhh about 8 months ago, I came into downtown vapes and I actually asked for the best thing that they had, I was told an IPV3 and I haven't touched a cigarette since then.

I started off on a vivi nova on a 900mA powered pen style battery, it wasn't much but it was all I have.

I started out with a smoke MX50 box with a dark horse RDA and 18650 battery and I haven't smoked in 10 months.

So I've been off cigarettes for almost a year now. I was a about a pack a day smoker. I started off on a pen style vape that my friend had given me for vaping, said it was the best way to quit cigarette so I tried it, moved on to a Mech mod, moved on to a Box mod and just kept upgrading and haven't smoked cigarette since.

I started off with a God box 180w with a Doge top, I also started smoking 30 nicotine but I went from smoking 3 and a half packs to 3 packs a day to zero packs soon as I got mine. And I've been smoke free for 19 months.
